

ABSTRACT

1 A method includes receiving a portion of JAVA™ language software
2 having a declaration of an instance of a generic class, parsing the declaration into a
3 token corresponding to the generic class, and generating an intermediate language
4 code block corresponding to the parsed declaration. The intermediate language
5 code block is executable by a runtime engine. A system for compiling includes a
6 parser receiving JAVA™ language source code having an instruction referencing
7 a generic class and specifying a type of the generic class, and a code generator
8 generating intermediate language code representing the source code.
